

TIME PETRI NETS FOR MODELLING AND ANALYSIS OF BIOCHEMICAL NETWORKS

- *ON THE INFLUENCE OF TIME* -

Monika Heiner
BTU, Computer Science Institute
monika.heiner (at) b-tu.de

❑ Why introduce time ?

- > *more information, less abstraction of reality*
- > *may involve boundedness = finite state spaces*

❑ How to introduce time ?

- > *qualitative - time - stochastic - continuous - hybrid Petri nets*
- > *modelling power : **TURING***
- > *analysis power : discrete state space construction (if bounded)*

❑ How to derive time parameters ?

- > *T-invariants -> steady state behaviour*

❑ Two open problems

- > *time-dependent boundedness* -> *weakly bounded*
- > *time-dependent liveness* -> *weakly live*

Petri nets

- basics -

□ atomic actions -> Petri net **transitions** -> chemical reactions

- ❑ **metabolic networks**
 - signal transduction networks**
 - gene regulatory networks**

- ❑ **transitions**
 - > *(reversible, stoichiometric) chemical reactions,*
 - > *enzyme-catalysed conversions of metabolites, proteins, . . .*
 - > *complexations / decomplexations, de- / phosphorylations, . . .*

- ❑ **places**
 - > *(primary, secondary) chemical compounds,*
 - > *(various states of) proteins, protein complex, genes, . . .*

- ❑ **tokens**
 - > *molecules, moles,*
 - > *concentration levels, gene expression levels, . . .*
(e.g., high / low = present / not present, or any finite number)

Time Petri nets

- basics -

❑ which net elements ?

-> places, *transitions*, arcs, tokens

❑ what kind of numbers ?

-> real, rationals, *integer*

❑ value range ?

-> *constant* - Time: $T \rightarrow \mathbf{N}_0$

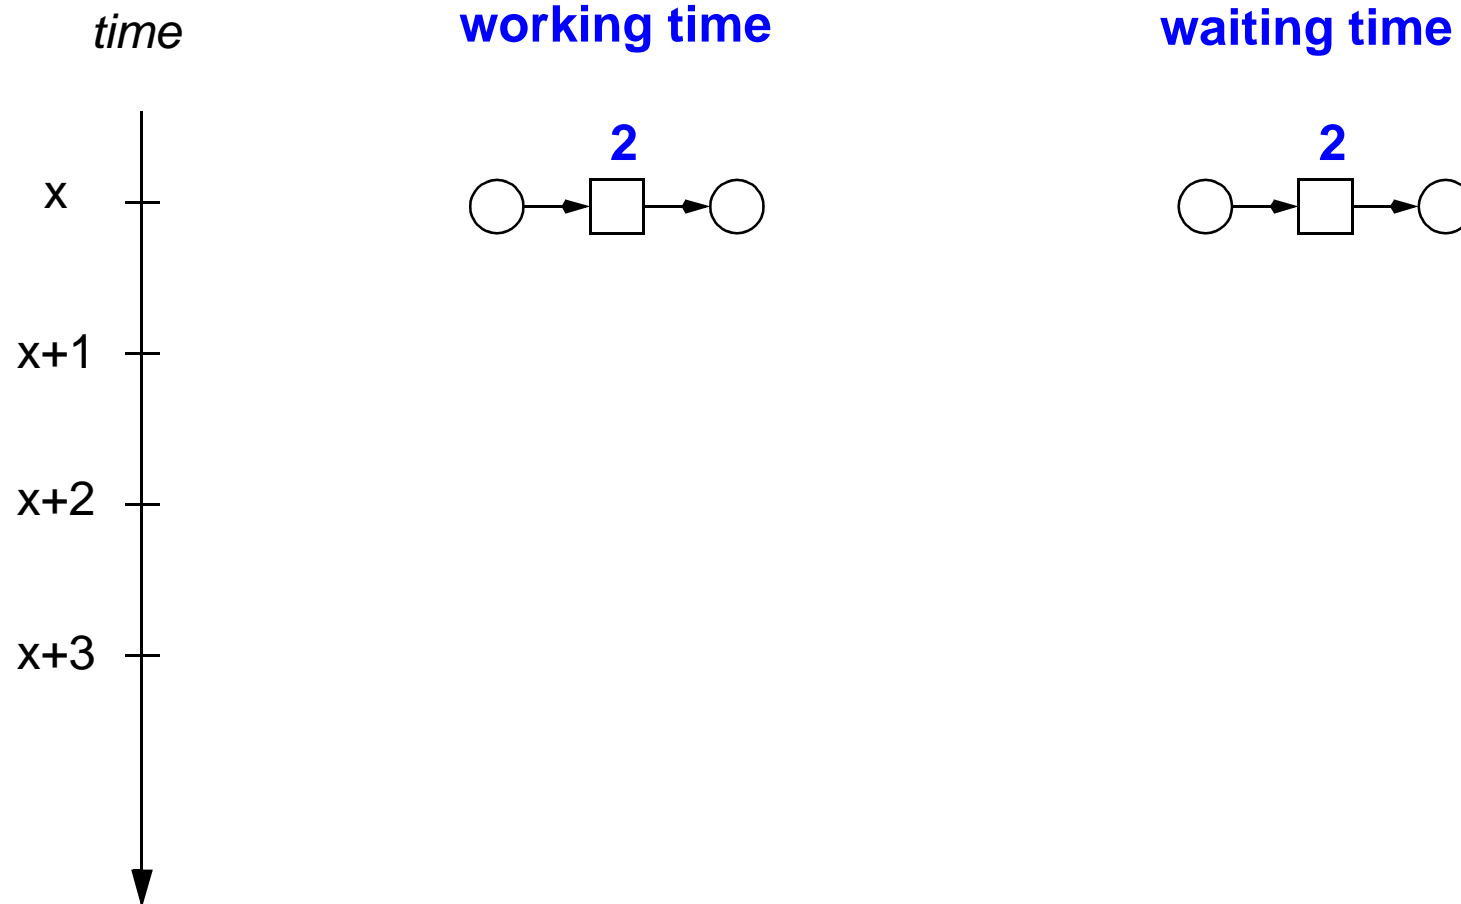

-> *interval* - Time: $T \rightarrow \mathbf{N}_0 \times \mathbf{N}_0 \cup \{\infty\}$ **continuous interval !**

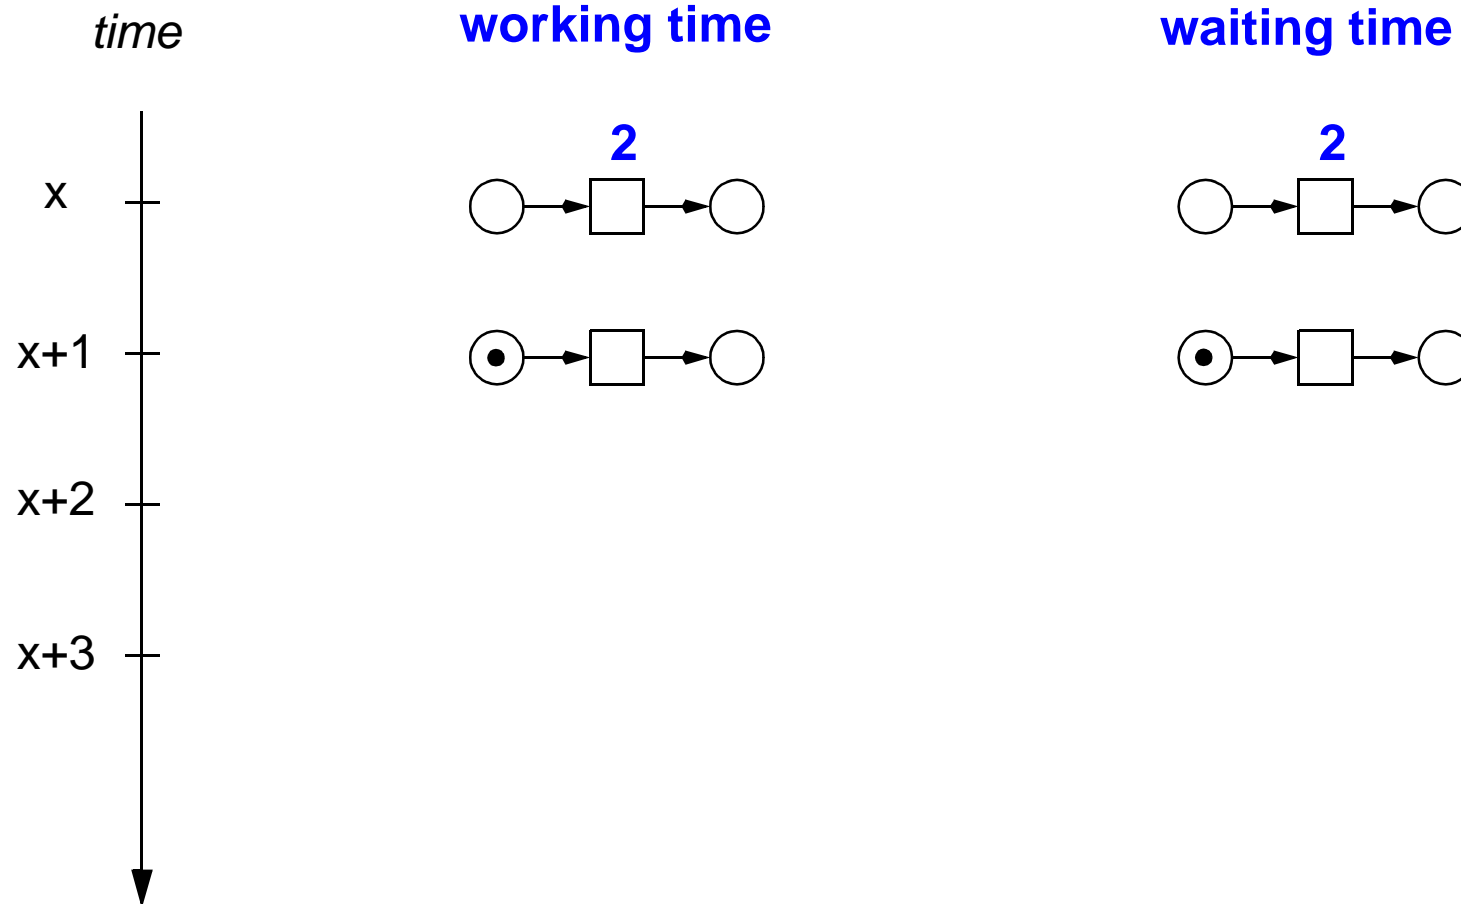

❑ firing rule

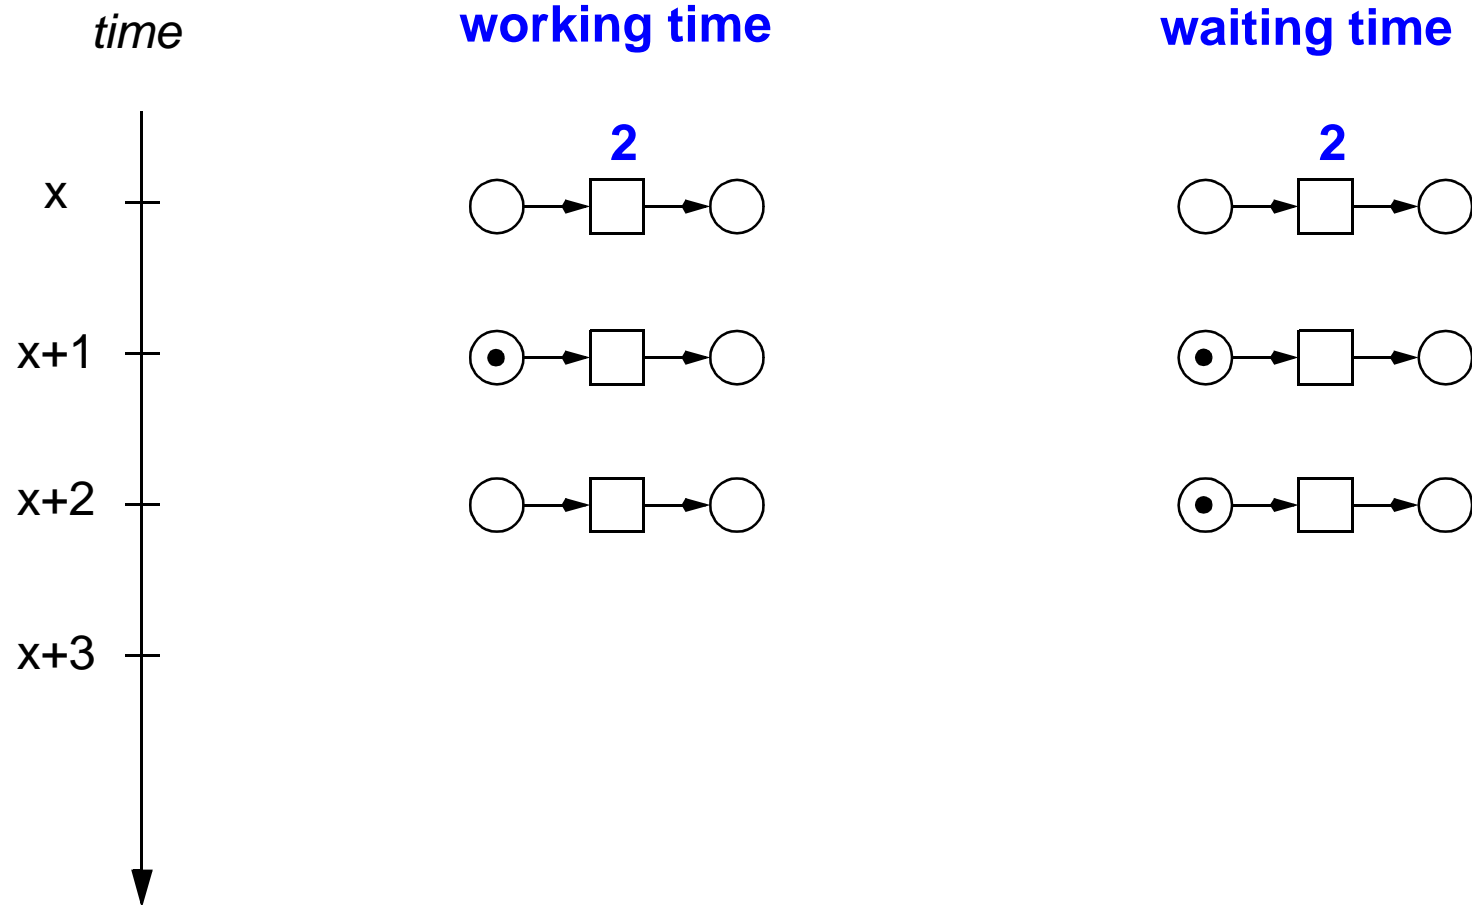

may \rightarrow must

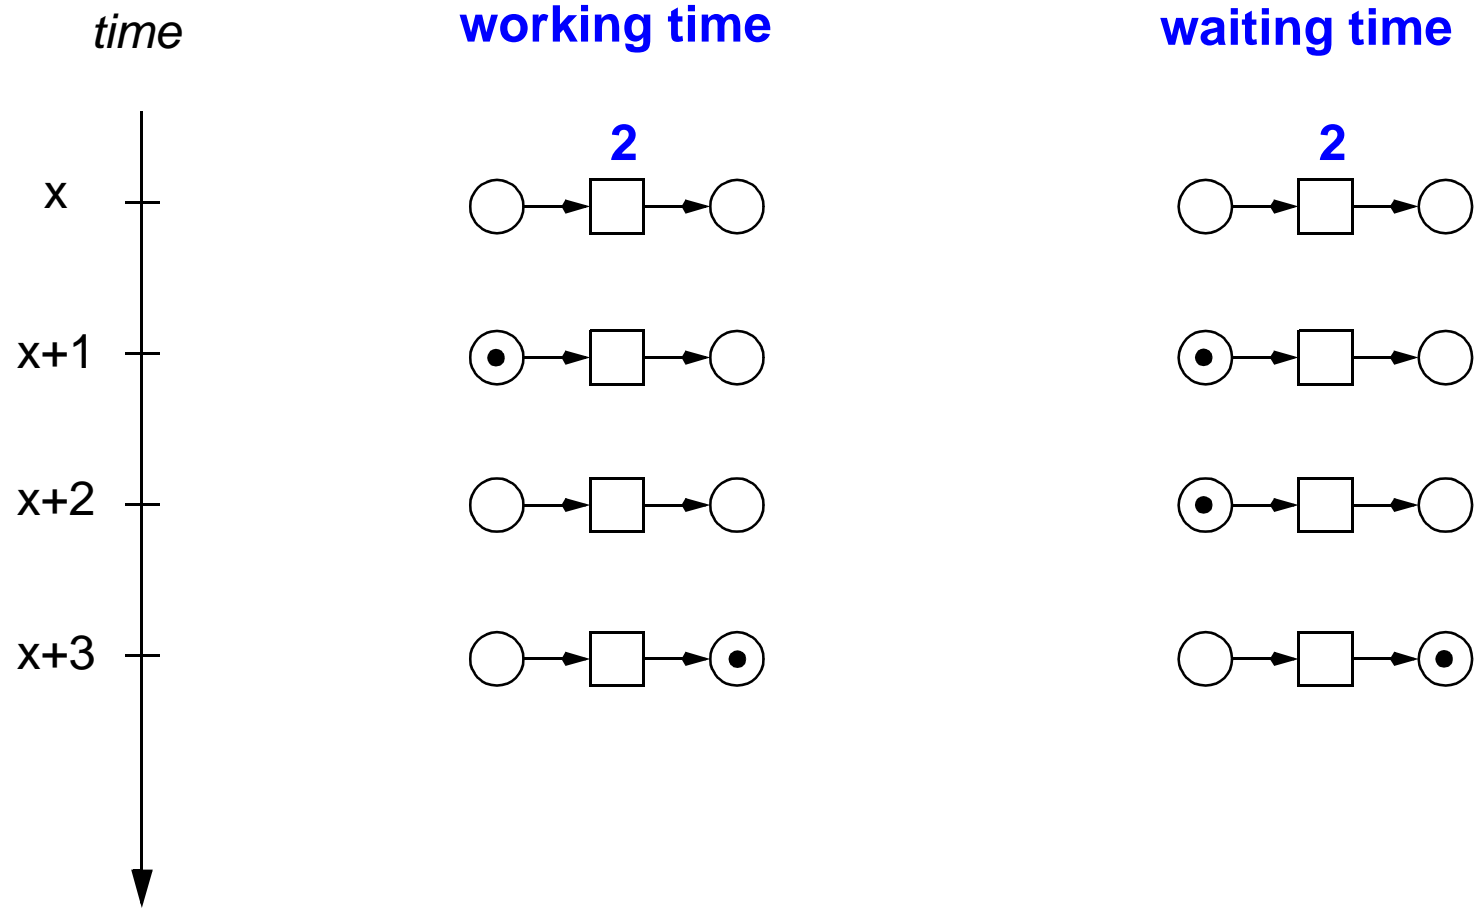

-> *working time* - transition reacts immediately,
(duration) firing lasts for the specified time

-> *waiting time* - transition reacts after the specified time,
(delay) firing itself does not consume time (-> stochastic Petri nets)

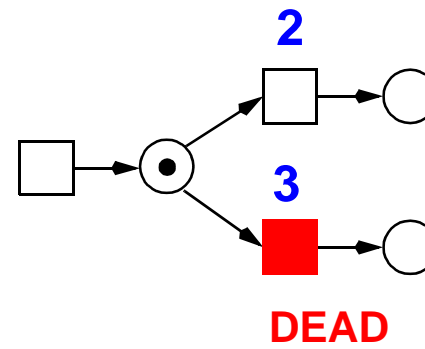

working time

waiting time

working time

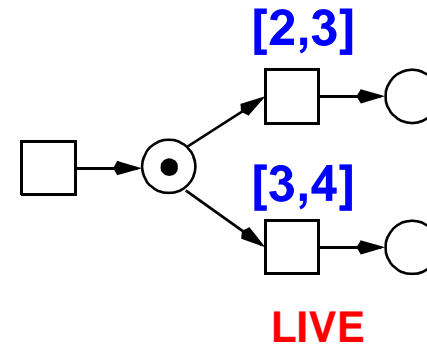

waiting time

working time

waiting time

TIMED PETRI NET

[Ramchandani 74]

non-preemptive firing

TIME PETRI NET

[Merlin 74]

preemptive firing

PETRI NET ?

WAITING TIME

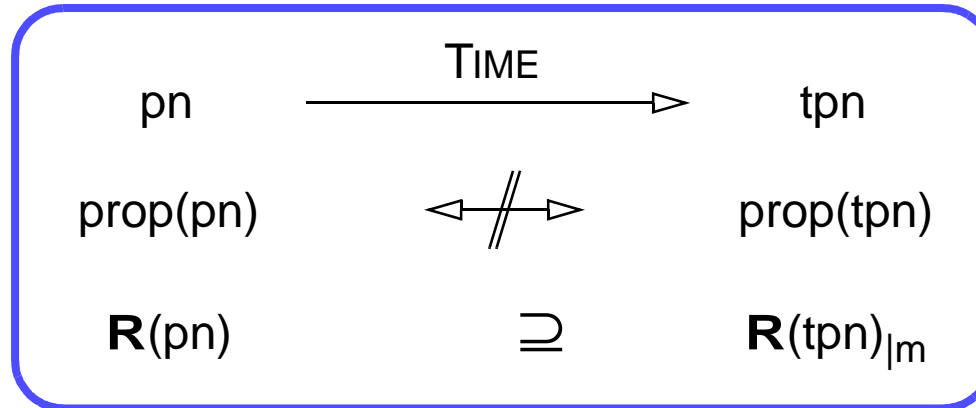

WORKING TIME

False: t_1, t_2, t_4
 True: t_1, t_2+t_3, t_5

- time may restrict the behaviour

- time may influence qualitative properties

TIME-INSENSITIVE PROPERTIES

BND (pn) \rightarrow BND (tpn)
not DSt (pn) \rightarrow not DSt (tpn)
 DTr (pn) \rightarrow DTr (tpn)

TIME-SENSITIVE PROPERTIES

not BND (pn) \rightarrow BND (tpn)
 DSt (pn) \rightarrow not DSt (tpn)
 LIVE (pn) \rightarrow not LIVE (tpn)
not LIVE (pn) \rightarrow LIVE (pn)

□ TIME-INDEPENDENT LIVENESS

-> *net structures, remaining live under any timing*

□ persistent (dynamically conflict free) nets

□ working time

-> *(homogeneous) ES nets, Starke 1990*

□ waiting time

-> *well-formed BFC nets, Popova 1994*

-> *well-formed ES nets, Popova 2010*

-> *well-formed =*

homogeneous &
timely homogeneous &
no purely immediate transitions

not homogeneous

not timely homogeneous

Problem 1:

time-dependent boundedness

- ❑ **given:** time-free Petri net
 - > *unbounded*
 - > *live (supposed to be)*

- ❑ **wanted:** corresponding time-dependent Petri net
 - > *(weakly) bounded*
 - > *(still) live*

- ❑ **T-invariants**

□ Lautenbach, 1973

-> Schuster, 1993

□ T-invariants

-> *multisets of transitions*

-> integer solutions x of $Cx = 0, x \neq 0, x \geq 0$

-> Parikh vector

□ minimal T-invariants

-> there is no T-invariant with a smaller support

-> *sets of transitions*

-> gcd of all entries is 1

□ any T-invariant is a non-negative linear combination of minimal ones

-> multiplication with a positive integer

-> addition

-> Division by gcd

$$kx = \sum_i a_i x_i$$

□ Covered by T-Invariants (CTI)

-> **consistency criterion**

-> each transition belongs to a T-invariant

-> BND & LIVE => CTI

- **T-invariants = (multi-) sets of transitions = Parikh vector**
 - > *zero effect on marking*
 - > *reproducing a marking / system state*

- **two interpretations**
 1. *partially ordered transition sequence* **-> behaviour understanding**
of transitions occurring one after the other
 - > *substance / signal flow*
 2. *relative transition firing rates*
of transitions occurring permanently & concurrently
 - > *steady state behaviour*

- **a T-invariant defines a subnet** **-> partial order structure**
 - > *the T-invariant's transitions (the support),*
+ all their pre- and post-places
+ the arcs in between
 - > *pre-sets of supports = post-sets of supports*

- **T-invariants = (multi-) sets of transitions = Parikh vector**
 - > *zero effect on marking*
 - > *reproducing a marking / system state*

- **two interpretations**
 1. *partially ordered transition sequence* **-> behaviour understanding**
of transitions occurring one after the other
 - > *substance / signal flow*
 2. *relative transition firing rates*
of transitions occurring permanently & concurrently
-> steady state behaviour

- **a T-invariant defines a subnet** **-> partial order structure**
 - > *the T-invariant's transitions (the support),*
+ all their pre- and post-places
+ the arcs in between
 - > *pre-sets of supports = post-sets of supports*

- ❑ **given:** time-free Petri net
 - > *unbounded*
 - > *live (supposed to be)*

- ❑ **wanted:** corresponding time-dependent Petri net
 - > *(weakly) bounded*
 - > *(still) live*

- ❑ **T-invariants -> relative transition firing rates**
 - > *may be implemented by transition firing duration (constant / interval)*

- ❑ **claim**
 - > *transformation preserves all possible behaviour (= minimal T-invariants)*

- ❑ **guess**
 - > *transformation reflects the steady state, so the model should become bounded*

□ **transient state**

□ **steady state**

- ❑ contains all transitions
 - > *always running*
 - > *start / end at different time points*
- ❑ contains all minimal T-invariants
- ❑ timing diagram
- ❑ relative transition firing rates

prod_A	:	1	+		:	1
r1	:	1	r2	:	1	
cons_B	:	2	cons_C	:	3	

- ❑ CTI,
but not CPI

- ❑ transient state
 - > *initial behaviour*
to reach steady state
 - > *not REV*
 - > *generally, not DCF*

- ❑ steady state behaviour
 - > *terminal scc*
 - > *here, BND*
 - > *here, DCF*

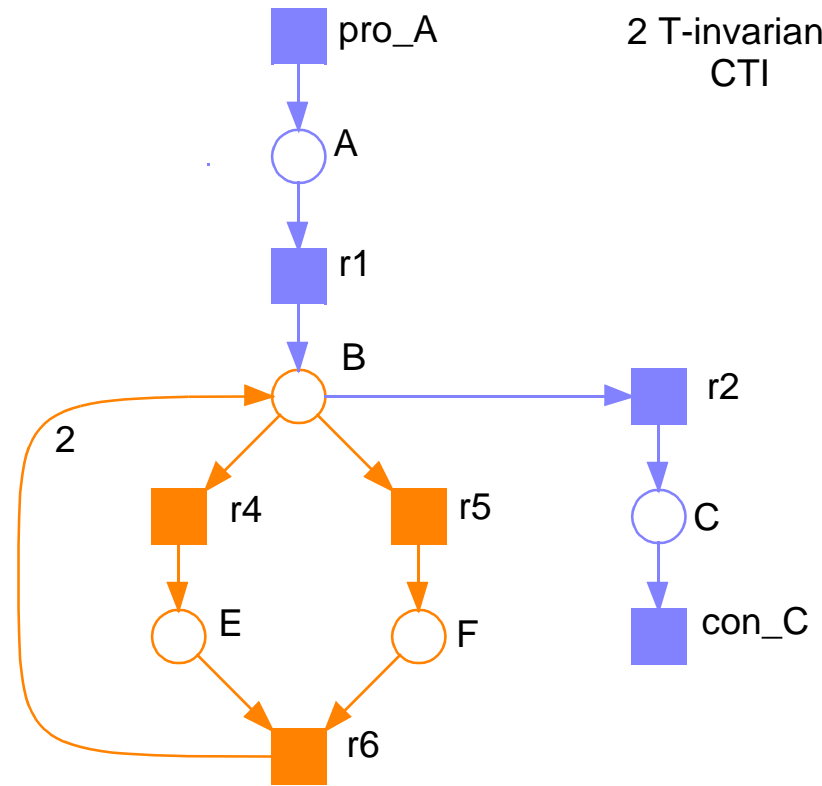

**However,
this does not always work !**

COUNTEREXAMPLE 1

1-working time for all transitions;

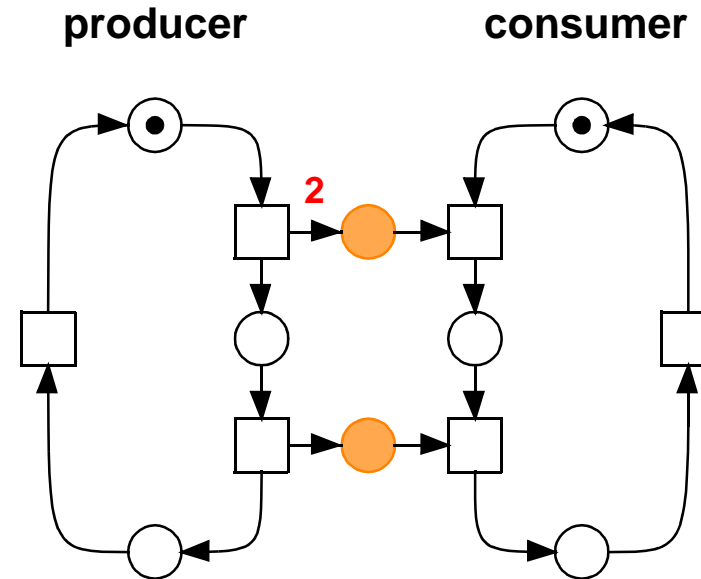

FC, there are no deadlocks, traps, P-invariants, besides the pseudo-P-invariant (A , co_A);

wBND & LIVE for the given initial marking

**weakly bounded
(CTI)**

**not weakly bounded
(not CTI, sur-T-invariant)**

[DESEL 2006], WEAKLY BOUNDED PETRI NETS; AWPN '06

- ❑ **given:** time-free Petri net
 - > *unbounded*
 - > *live (supposed to be)*

- ❑ **wanted:** corresponding time-dependent Petri net
 - > *(weakly) bounded*
 - > *(still) live*

- ❑ **questions**
 - > *for which structures does it work / does it not work ?*
 - > *are there sufficient / necessary conditions ?*
 - > *which time intervals make the net bounded ?*
 - > *which time intervals preserve a transition sequence's realizability ?*

- ❑ **consistency criterion for (steady state) bio networks !?**

Problem 2:

time-dependent liveness

EXAMPLE - GLYCOLYSIS

live under certain timing constraints

EXAMPLE - GLYCOLYSIS

the red transition brings liveness under any timing

❑ **problem 1: time-dependent boundedness**

-> *given: unbounded and live time-free Petri net*

-> *question: under which conditions are there time restrictions, making this Petri net (weakly) bounded, while preserving liveness ?*

❑ **problem 2: time-dependent liveness**

-> *given: non-live time-free Petri net*

-> *question: under which conditions are there time restrictions, making this Petri net live ?*

-- especially helpful for analyzing bio Petri nets --

Thanks !
