Accelerated Simulation of Hybrid Biological Models

э

- Hybrid simulation (of biological reaction networks) combines deterministic and stochastic regimes to execute a model.
- It can be used as an alternative approach when it is not possible to perform a pure stochastic simulation.
- It provides a trade-off between accuracy and efficiency of model execution.

Introduction: How Does It Work?

Repeat the following steps:

- (Re)initialise the ODE solver
- Numerically integrate the system of ODEs until a stochastic event is to occur
- Find the index of the stochastic reaction to occur
- Fire this stochastic reaction
- Update the propensities of the stochastic reactions

→ ∃ →

Introduction: How Does It Work?

Crucial for hybrid simulation performance: calculation of exact time when next stochastic reaction is to occur
Can be done, e.g., using

$$\int_{t}^{t+\tau} a_0^s(\mathbf{x})dt + \log(p_1) = 0, \qquad (1)$$

(日)

where

- **x** state vector of the model at time t,
- a_0^s cumulative propensity of stochastic reactions,
- p_1 random number generated from U(0, 1).

Haseltine, Rawlings, J. Chem. Phys. (2002)

• Similarly, the index of the next reaction to fire can be selected as the first index μ satisfying

$$\sum_{j=1}^{\mu} a_j^s(\mathbf{x}) > p_2 a_0^s(\mathbf{x}) \,, \tag{2}$$

(日)

where

- a_j^s propensity of the j^{th} slow reaction,
- p_2 random number generated from U(0, 1).

Haseltine, Rawlings, J. Chem. Phys. (2002)

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models

Introduction: a Performance Issue

- Each time a stochastic event takes place, a discontinuity in the system of ODEs may occur.
- To deal with discontinuities, the ODE solver must be reinitialised after the firing of each stochastic reaction.
- Frequent reinitialisation of the ODE solver introduces additional computational overhead.
- We assume a modular design of the ODE solver and the stochastic simulator; this requires adaptive step-size ODE solvers, recording

accuracy and history information.

→ Ξ →

Introduction: a Performance Issue

Do we need to accept all these reinitialisations?

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models < 同 ▶

→

To overcome this problem, we classify the set of stochastic reactions into three groups according to their relation to the deterministic regime:

- **1** reactions with no dependency
- **2** reactions with direct dependency interface reactions
- **3** reactions with indirect dependency

< ≣ >

Completely Independent Reactions

- Such reactions do not share any species with the reactions in the deterministic regime.
- Also, their substrates and products are not used to define reaction rates in the deterministic regime.

Completely Independent Reactions: (Example)

The two reactions:

$$S_1 + S_2 \xrightarrow{k_1} P_1$$
$$S_3 + S_4 \xrightarrow{k_2} P_2$$

are independent of one another.

< 17 >

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models

Reactions with Direct Dependency

- Such reactions share certain species with the continuous regime.
- Their substrates and products may be used to define reaction rates in the deterministic regime.

→ Ξ →

Reactions with Direct Dependency (Example)

The two reactions:

$$S_1 + S_2 \xrightarrow{k_1} P_1$$
$$P_1 + S_3 \xrightarrow{k_2} P_2$$

have a direct dependency.

< 同 ▶

M. Herajy and M. Heiner 2016

Accelerated Simulation of Hybrid Biological Models

Reactions with Indirect Dependency

- Such reactions do not share any species with the continuous regimes.
- Their substrates and products are used to define reaction rates in the deterministic regime.

→ Ξ →

Reactions with Indirect Dependency (Example)

The two reactions:

$$S_1 + S_2 \xrightarrow{k_1} P_1$$
$$S_3 + S_4 \xrightarrow{k_2 * P_1} P_2$$

have an indirect dependency.

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models

Following this classification, we reinitialise the ODE solver in case of:

- a stochastic reaction with direct dependency fires,
- for some special cases of stochastic reactions with indirect dependency.
- We use an idea similar to the dependency graph.

▲ 同 ▶ → ● ▶

However, Eq. (1) still requires the reinitialisation of the ODE solver each time a stochastic event occurs.
One workaround is to approximate (1):

$$\int_{t}^{t+\tau} a_0^s(\mathbf{x}) dt + \log(p_1) = 0$$

by

$$a_0^s(\mathbf{x}) \cdot \Delta \tau + \log(p_1) = 0, \qquad (3)$$

where

- $\Delta \tau$ time difference between occurrence time of the previous event and the current event,
- p_1 random number generated from U(0, 1).

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models

- Originally been proposed by Gibson, Bruck (2000)
- Reduces the number of propensity updates following every reaction firing
- Stores for each reaction the set of other reactions that will be affected by every occurrence

- We assume that the dependency graph of all reactions is already constructed
- Manipulated species: the set of species that are altered when a reaction takes place
- E.g., the set of manipulated species for the reaction $S_1 + S_2 \xrightarrow{k_1} P_1$ is $M = \{S_1, S_2, P_1\}$

Accelerated Simulation of Hybrid Biological Models

Algorithm1: Extracting the Dependency Information (Cont.)

- Input: the sets of slow and fast reactions (G_s, G_f)
- Output: the set of interface reactions
- Steps:
 - Find the intersections of manipulated species for each pair of reactions $(r_1 \in G_s, r_2 \in G_f)$
 - If intersection set is not empty, mark r₁ as an interface reactions

イロト イポト イヨト イヨ

Algorithm1: Extracting the Dependency Information

Algorithm 1 Finding Interface Reactions

Require: G_s the set of slow reactions;

Require: G_f the set of fast reactions;

- 1: $R^* = \phi$ {the set of marked interface reactions is initially empty}
- 2: for each r_i in G_s do
- 3: let S_i denotes the set of manipulated species when r_i fires;
- 4: for each s_{ij} in S_i do
- 5: Find the set of other reactions, R_{ij} , that manipulate s_{ij} when they fire;
- 6: **if** $\exists r_j \in R_{ij}$ and $r_j \in G_f$ then
- 7: Add r_i to R^* ; {Mark r_i as an interface reaction}
- 8: end if
- 9: end for
- 10: end for
- 11: return R^* ;

	Algorithms	

Algorithm 1: Example

#	Slow Reactions	M. Species
r_1	$\phi \xrightarrow{s} A$	$\{A\}$
r_2	$A \xrightarrow{d} \phi$	$\{A\}$
r_3	$\phi \xrightarrow{s} B$	$\{B\}$
r_4	$B \xrightarrow{d} \phi$	{B}
r_5	$A + B \xrightarrow{k_1} B + C$	$\{A, B, C\}$

#	Fast Reactions	M. Species
r_6	$C + E \xrightarrow{k_2} D$	$\{C,D,E\}$
r_7	$D \xrightarrow{k_3} C + E$	$\{C, D, E\}$
r_8	$D \xrightarrow{dd} \phi$	{D}

• $\{r_1 - r_4\}$ – independent reactions

• $R^* = \{r_5\}$ – dependent/interface reaction

M. Herajy and M. Heiner 2016

Accelerated Simulation of Hybrid Biological Models

Algorithm 2: Accelerated Hybrid Simulation

- Makes use of the information collected from Algorithm 1
- Initialises the ODE solver only when the firing stochastic reaction belongs to the marked list

▲ □ ▶ ▲ □ ▶

Algorithm 2: Accelerated Hybrid Simulation (Cont.)

Algorithm 2 Accelerated Hybrid Simulation

Require: G_s and G_f : the sets of slow and fast reactions respectively;

Require: R^* the set of reactions marked as interface reactions;

1: Initialise the ODE solver with the initial concentration of the variables in G_f ;

2: set
$$\tau = \tau_{old} = 0$$
;

- 3: while we did not reach end simulation time ${\bf do}$
- 4: Generate two random numbers p_1 and p_2 from the uniform distribution;

5: repeat

- 6: Numerically integrate the system of ODEs;
- 7: **until** $a_0^s(\mathbf{x}) \cdot (\tau \tau_{old}) + log(p_1) = 0$ {cf., Eq., (5)}
- 8: **Update** $(a(r_i), a_0^s), \forall r_i \in G_s, \forall r_j \in G_f : \mathbf{Base}(r_i) \cap \mathbf{Manipulated}(r_j) \neq \phi;$
- 9: Find the reaction r_{μ} that satisfies (2) using p_2 ;
- 10: Fire r_{μ} and update the system state as well as the current time τ ;
- 11: **Update** $(a(r_i), a_0^s), \forall r_i : \mathbf{Base}(r_i) \cap \mathbf{Manipulated}(r_\mu) \neq \phi;$
- 12: Set $\tau_{old} = \tau$
- 13: **if** $r_{\mu} \in R^*$ **then**
- 14: Reinitialise the ODE solver

M. Herajy and M. Heiner 2016

Accelerated Simulation of Hybrid Biological Models

<ロ> (日) (日) (日) (日) (日)

- In some cases, reactions with indirect dependency can cause discontinuity
- For example, when an enzyme value goes from 0 to 1, or vice versa
- The state of such a species can be monitored for such behaviour
- The ODE is reinitialised only when a species values flipping form 0 to 1, or vice versa

Herajy, Schwarick, Heiner, ToPNoC (2013)

M. Herajy and M. Heiner 2016

Accelerated Simulation of Hybrid Biological Models

- The model consists of 26 species and 48 reactions.
- The number of generated stochastic events for both simulators are comparable.
- The accelerated simulation algorithm is about two times faster than the exact method

< ∃ >

Case Study: Eukaryotic Cell Cycle

M. Herajy and M. Heiner 2016 Accelerated Simulation of Hybrid Biological Models

- This hybrid model is based on the stochastic one by Barik et al., 2010
- The model consists of:
 - A set of phosphorylation and dephosphorylation reactions of many proteins
 - Synthesis and degradation of mRNAs
- Phosphorylation and dephosphorylation reactions are simulated deterministically, and
- Reactions related to mRNAs are simulated stochastically

▲ 同 ▶ ▲ 国 ▶ ▲ 国

- We use coloured hybrid Petri nets to construct and simulate this model.
- The model consists of 60 species and 190 reactions.
- The number of generated stochastic events for both simulators are comparable.
- The accelerated simulation algorithm is about
 10 times faster than the exact method.

43 / 47

- We have presented an approach for improving the performance of hybrid simulation algorithms.
- The suggested improvements will be useful to cope with the rapid growth of (biological) models.
- For smaller models, the accelerated algorithm is about three times faster than the exact method.
- For larger models, there is a substantial improvement in terms of runtime (10 times faster).

→ ∃ →

- This result is due to saving the ODE solver from repeating the work required to build accuracy and history information.
- Therefore, as soon as the model size is increased, the simulator performance is also improved.

< E.

- Applying the proposed algorithms to more examples.
- Investigating dynamic partitioning in combination with the presented algorithm.
